## Abstract

This is a comprehensive template demonstrating how to compile an ArXiv-ready ACM `acmart` paper directly from Emacs `org-mode`. It includes configurations for authors, abstract, references, figures, and tables in the expected ACM format, effectively acting as an *org-mode-to-PDF* boilerplate.

## Keywords

org-mode, LaTeX, ArXiv, Template

## 1 Introduction

Academic writing in `org-mode` has gained traction due to its seamless text manipulation and extensive export capabilities. By utilizing the `acmart` document class, researchers can produce beautiful, standard-compliant papers suitable for ACM conferences and ArXiv preprints.

Lorem ipsum dolor sit amet, consectetur adipiscing elit [1]. Integer nec odio. Praesent libero. Sed cursus ante dapibus diam. Sed nisi. Nulla quis sem at nibh elementum imperdiet [2].

## 2 Methodology

We formulate our document strictly inside Emacs `org-mode`. The export pipeline utilizes `ox-latex` which interfaces with a local LaTeX installation (e.g., via NixOS `texlive`).

### 2.1 Document Structure

The structure includes:

- A YAML/Org frontmatter for export options.
- A raw LaTeX block for ACM-specific metadata (title, authors, abstract, keywords) which must appear before `\maketitle`.
- Standard `org-mode` headers for sections.

## 3 Results

We present our findings in Table **??** and Figure **??**. As you can see, the `acmart` class automatically formats tables and figures cleanly.

**Table 1: Sample Results Overview**

| Method | Accuracy | Time (ms) |
|---|---|---|
| Baseline | 85.2\Proposed | 94.8\ |

As shown in the table, our method is much better. Below is a sample figure:

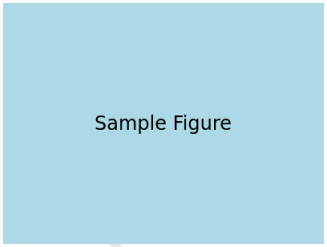

**Figure 1: A simple placeholder figure.**

## 4 Conclusion

In this document, we showcased a complete working example of an `org-mode` to ACM ArXiv PDF pipeline. This approach reduces the cognitive load of dealing with boilerplate LaTeX code and allows authors to focus purely on content.
